

## PHAR

Running applications out of the box  
Costa Rica Tech Summit

**Pablo Viquez**

Senior PHP Developer, Open Source Platforms  
pviquez@schematic.com

# Agenda

- What are they
- Reasons to use them
- Requirements
- Installation
- How do they work
- PHAR Extension
- PHAR How to's
- PEAR
- Current Issues
- Performance

# What are they?

# What are they?

- PHP->PHAR = Java.JAR
- A way to put entire PHP applications into a single file

- Single file that contains multiple files
- Can be accessed if it they were a regular files with filesystem functions

# Why use it?

- Easy deployment.
- Security
  - Source inaccessible.
  - Files cannot be modify manually.
  - Write to file can be controlled.
- Portability
  - Very useful for libraries or code repositories.
- Compression
  - Zip or bz2

# Requirements

Available starting PHP 5.2

Included in PHP 5.3

Compress Phar files:

- bzip2
- Zip

Signature verification:

- Hash

OpenSSL Signing :

- OpenSSL Extension

General usage (php extension)

- SPL

# Installation

For simple usage:

- Just run it!
- Enable `php_phar` extension

2 options for creation

- PEAR package:
  - `PHP_Archive_Creator`
  - `pear install PHP_Archive-alpha`
- PHAR extension from PECL
  - `pecl install phar`

**\*nix:**

```
extension=phar.so
```

**Windows:**

```
extension=php_phar.dll  
extension=php_bz2.php  
extension=php_zip.php
```

# How does it work

How do the access to a regular file happens

```
$file = file_get_contents( 'foo.txt' );
```

PHP “translate” the code into something like this:

```
$file =  
    file_get_contents(  
        'file:///path/to/file/foo.txt' );
```

# How does it work

Making a regular include as follow:

```
require_once 'phar://path/to/bar.phar/foo.txt';
```

Since phar was implemented as a stream wrapper, it supports stream-handling functions such:

```
fopen()  
file_get_contents()  
opendir()  
readdir()  
copy()  
rename()
```

# Closer look...

Doing reflection on the class:

```
class Phar extends RecursiveDirectoryIterator
    implements RecursiveIterator,
               SeekableIterator,
               Traversable,
               Iterator,
               Countable,
               ArrayAccess
{
    // ...
}
```

# Closer look...

A phar archive can be one of three possible formats:

- ZIP
- TAR

The third is a customized file format designed specifically for phar, bringing more efficiency and performance.

- PHAR file format offers additional features such as intrinsic file-verification signatures.

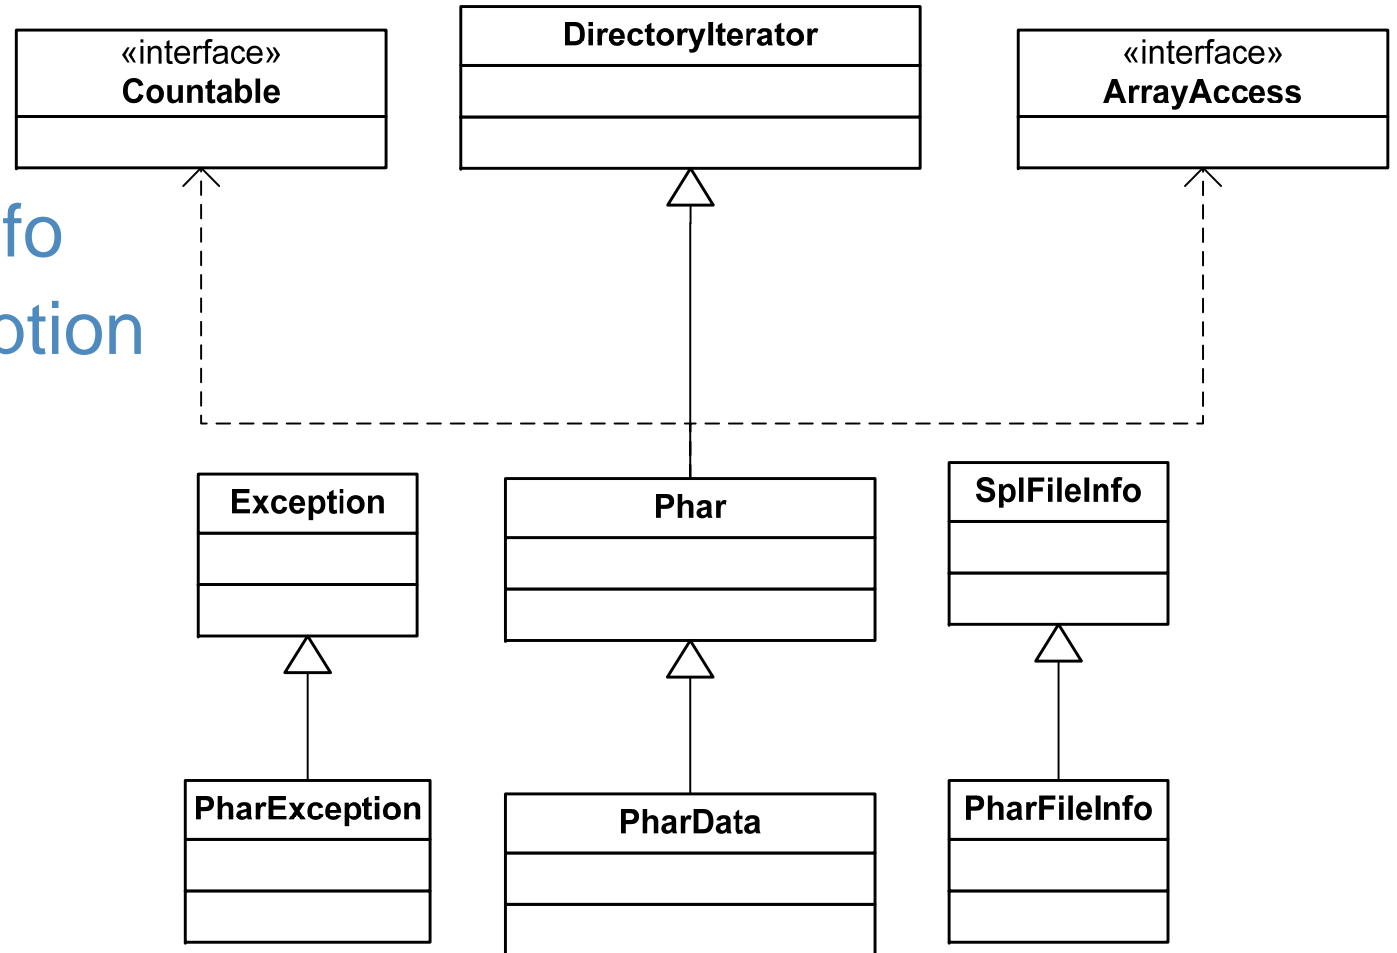

# Closer look...

Features	Phar	Tar	Zip
Stub file	Built-in	As file .phar/stub.php	As file .phar/stub.php
Can be execute without the extension?	Yes	No	No
Per file compression	zlib/bzip2	None	zlib (read/write) / bzip2 (read-only)
Whole archive compression	gz / bz2	gz / bz2	None
Archive signature	Yes	Yes	Not yet
Creation	Yes	Yes	Yes
Direct execution (php foo.phar)	Yes	Yes	Yes
Stream wrapper support	Yes	Yes	Yes
Works with phar object regardless of content	Yes	Yes	Yes
Can be created/mod with phar=readonly=1	No	Yes	Yes

# Phar Extension Classes

The Phar extension makes available 4 classes:

- Phar
- PharData
- PharFileInfo
- PharException

# Phar::Phar

- Supports reading and manipulation of Phar archives.
- Iteration through inherited functionality of the “RecursiveDirectoryIterator” class.
- Files inside a Phar can be accessed as an associative array, due the implementing of ArrayAccess interface.
- In order to be executable, a stub file is required.
  - A stub file, is used to set the PHP loader or bootstrap stub of a Phar archive
  - The stub file must end with the “\_HALT\_COMPILER()” token

# Phar Ini File

[Phar]

phar.readonly = Off

phar.require\_hash = Off

;phar.cache\_list =

## Phar

Phar: PHP Archive support	enabled
Phar EXT version	2.0.0-dev
Phar API version	1.1.1
CVS revision	\$Revision: 1.370.2.44 \$
Phar-based phar archives	enabled
Tar-based phar archives	enabled
ZIP-based phar archives	enabled
gzip compression	enabled
bzip2 compression	disabled (install pecl/bz2)
OpenSSL support	disabled (install ext/openssl)

# Phar::Phar – How to create a Phar

```
void Phar::__construct (string $fname [,int $flags [, string $alias ]] )
```

```
<?php
$p = new Phar( '/path/foo.phar', 0, 'foo.phar' );

// Start transaction
$p->startBuffering();

// add a new file via the array access API
$p['index.php'] = file_get_contents( '/path/app/index.php' );
$p['images/php.gif'] = file_get_contents( '/path/app/images/php.gif' );

$p->setMetaData( array( 'bootstrap' => 'index.php' ) );

// Save to disk
$p->stopBuffering();
```

# Phar::Phar – Useful functions

## Phar::webPhar()

Parses the `$_SERVER['REQUEST_URI']` and simulates a web server, routing requests to the correct file.

`Phar::webPhar()` should only be called from the stub of a phar archive.

```
$phar = new Phar( '/file/foo.phar' , 0 , 'foo.phar' );  
$phar->buildFromDirectory( '/app/dir' );  
$phar->setStub( '<?php  
Phar::webPhar( ) ;  
__HALT_COMPILER( ) ; ?>' );
```

```
void  
Phar::webPhar(  
    string $alias,  
    string $index,  
    string $f404,  
    array $mimetypes,  
    array $rewrites)
```

# Phar::Phar – Useful functions

Phar::interceptFileFuncs()

Void Phar::interceptFileFuncs()

Intercept fopen, file\_get\_contents, opendir, and all of the stat-related functions.

```
$a = new Phar( 'phpMyAdmin.phar.tar.php' );  
$a->startBuffering();  
$a->setStub( '<?php  
Phar::interceptFileFuncs();  
Phar::webPhar(  
    "phpMyAdmin.phar",  
    "phpMyAdmin-2.11.3-english/index.php" );  
__HALT_COMPILER();  
' );  
$a->stopBuffering();
```

# Phar::Phar – Useful functions

## Phar::compress()

Compresses the entire Phar archive using Gzip or Bzip2 compression.

```
$p = new Phar('/file/foo.phar', 0, 'foo.phar');  
$phar->buildFromDirectory('/app/dir');  
$p1 =  
    $p->compress(  
        Phar::GZ); // copies to /path/to/my.phar.gz  
$p2 =  
    $p->compress(  
        Phar::BZ2); // copies to /path/to/my.phar.bz2
```

```
object  
    Phar::compress(  
        int $compression  
        [,string $extension])
```

# Phar::Phar – Useful functions

## Phar::buildFromIterator()

Construct a phar archive from an iterator..

```
$files =  
    $phar->buildFromIterator(  
        new RegexIterator(  
            new DirectoryIterator('.'),  
            '/^frontcontroller\d{0,2}\  
.phar\.phpt\z|^\.\.z|^\.\.\.z/' ),  
        dirname(__FILE__) . DIRECTORY_SEPARATOR);
```

Directory iterator grabbing all files named  
frontcontroller\*.phar.phpt and putting them into the phar archive.

```
array  
    Phar::buildFromIterator(  
        Iterator $iter  
        [,string $base_directory])
```

# PEAR - PHP\_Archive

Phars created using the PHP\_Archive package can be executed using plain PHP, without any external dependencies at all.

PECL extensions may require pecl/Phar to be enabled before they can be read, depending on the Phar version used to make them.

To create Phar files using the PEAR class, you need to use the `PHP_Archive_Creator` class

# PEAR - PHP\_Archive

## PHP\_Archive\_Creator

- Can pre-process files before archiving them.
- Can strip unnecessary whitespace and comments.
- Alter `require_once` statements to refer to files within the archive.
- Create archives that use `pecl/Phar` if the extension happens to be available.
- Enables you to crawl a filesystem and recursively add files to an archive with a single method call.
- Sophisticated levels of wildcard-based file inclusion or exclusion within that filesystem.
- Does not create signatures by default
  - `php.ini - phar.require_hash = Off`

# PEAR - PHP\_Archive

```
// Use Phar_Archive_Creator from PEAR
require_once 'PHP/Archive/Creator.php';
$creator =
    new PHP_Archive_Creator(
        'index.php',
        'foo.phar');

$creator->addString(
    "<?php echo 'Hello World';",
    'index.php');

$creator->savePhar(
    dirname(__FILE__) . '/foo.phar');
```

# PEAR - PHP\_Archive

There are four `PHP_Archive_Creator` methods for adding files into your phar archive:

`addString(string $contents, string $filename)` - Adds a string as the contents of a file with the name `$filename`.

`addArray(array $contents)` - Adds an array of files to the phar archive.

`addFile(string $file, string $filename)` - similarly opens a file and adds it to the phar archive with the name `$filename`.

`addDir(string $dir, array $ignore, array $include)` - Traverses a directory and adds its files recursively to the phar archive.

- `$ignore` and `$include` - Arrays containing full paths to files or filesystem wildcards like `*.php` or `i?m.txt`.

# PEAR - PHP\_Archive

The biggest problem is handling calls that include external code.

Calls to `__FILE__` or `__autoload()` offers no bigger problem.

Use of relative paths must be redefined:

```
// From:  
require_once 'Foo/Bar.php' ;  
  
// To:  
require_once 'phar://foo.phar/Foo/Bar.php' ;
```

# PEAR - PHP\_Archive

PHP\_Archive\_Creator solves this issue by providing callbacks that replaces the calls for inclusion within the application:

**simpleMagicRequire()** - Uses calls to `str_replace()` to replace all instances of `require_once` and `include_once` with an internal phar `require_once` / `include_once`.

**limitedSmartMagicRequire()** - Uses `preg_replace()` to similarly replace instances of `include` or `require` that use quotations.

**smartMagicRequire()** - Uses `preg_replace()`, but replaces all instances of `include` and `require`.

**tokenMagicRequire()** - uses the tokenizer extension to scan PHP files token by token. Replaces any executable `include/require` statements, ignoring all uses of the words "include" or "require" in comments or variable names.

# Current Phar Issues

As it's now, packing an application into a Phar file could be quite challenging.

- The concept of "current directory" has no meaning in a stream wrapper.
- `chdir()` and `getcwd()` only work for directories stored on physical disks. All references to `chdir()` or `getcwd()` therefore needed to be modified by hand.
- All uses of `opendir()` that reference internal application code had to either use `dirname(__FILE__)` or be hand-modified.

# Phar Performance

According to Phar Lead developer Greg Beaver, testing phpMyAdmin:

- Without APC: currently ~1.7x slower
- With APC: currently ~.3x slower

# Thank You
